Pattern-Avoidance

Fillings of grid shapes

contains one or both of
 $\begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$ and $\begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$
 (e.g. rows 1,2; cols 2,3)

avoids both
 $\begin{pmatrix} 0 & 0 \\ 0 & 0 \end{pmatrix}$ and $\begin{pmatrix} 1 & 1 \\ 1 & 1 \end{pmatrix}$

Equivalence

$\begin{pmatrix} 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$ is equivalent to $\begin{pmatrix} 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 \end{pmatrix}$ in

means $\{\# \text{ fillings of } S \text{ avoiding } \begin{pmatrix} 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}\} = 190 = \{\# \text{ fillings of } S \text{ avoiding } \begin{pmatrix} 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 \end{pmatrix}\}$

Can also say: $\begin{pmatrix} 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 0 \end{pmatrix}$ is equivalent to $\begin{pmatrix} 0 & 0 & 1 & 1 \\ 1 & 1 & 0 & 0 \end{pmatrix}$ in all Young shapes.

Permutations

54213 \leftrightarrow

○ is 0
 ● is 1

avoids

$\leftrightarrow 123$

contains

$\leftrightarrow 312$

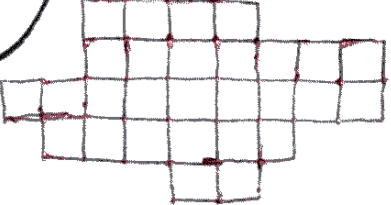

Wilf-equivalence

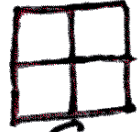

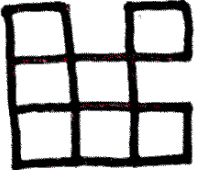

123 is Wilf-equivalent to 312 means:

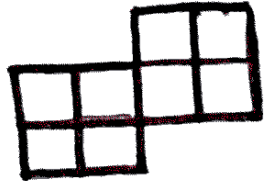

$$\{\# \sigma \in S_n \mid \sigma \text{ avoids } 123\} = C_n = \{\# \sigma \in S_n \mid \sigma \text{ avoids } 312\}$$

Preliminaries (Definitions)

Complement Replace \circ by \bullet , and conversely. E.g. $(\circ\circ|\bullet\circ) \leftrightarrow (\bullet\bullet|\circ\bullet)$. Complementary pattern pairs are equivalent by the obvious bijection.

Connected (hv) shapes Any row or column of the shape is ^{horizontally} _{vertically} connected, e.g. .

2x2-connected shapes One can walk from any cell to any other, with each step moving between two cells in some  subshape, which contains the current cell. E.g.  is 2x2-connected, but

 is not 2x2-connected.

Complete-rectangle (CR) Erasability

A cell a has a complete rectangle if for any cell r in its row and any c in its column, the cell p in r 's column and c 's row is in the shape.

A shape S is complete-rectangle erasable if it is the empty shape or if it has a cell c with a complete rectangle, such that deleting c from S ($S \setminus c$) makes a smaller CR-erasable shape.

light - possible cs & rs.
dark - possible ps.

S is (property)-CR-erasable — this is just like CR-erasability, with the extra constraints that c has (property), and $S \setminus c$ is (property)-CR-erasable, e.g.

bottom-CR-erasable: c is bottommost in its column.
bottom-right-CR-erasable: c is bottommost in its column and rightmost in its row.

Examples, with erasure order:

CR-erasable but not bottom-CR-erasable but not bottom-right-CR-erasable

Motivation

Examples Equinumerous objects
Totally nonnegative Grassmann
cells of $\Omega\lambda$, for Young shape λ .

In the
language of
pattern-avoidance

↕ Alex Postnikov [2]

J("le")-diagrams, invented by Postnikov,
q-enumeration by Lauren Williams.

Def: 0/1-filling of λ , which avoids
the $\begin{smallmatrix} \square & \square \\ \square & \square \end{smallmatrix}$ pattern:

[2] Postnikov
[3] key lemma by Williams

Acyclic orientations of G_λ , a
bipartite graph with λ 's rows and
columns as vertices, and edges
corresponding to λ 's cells. A filling
then naturally orients the edges.

avoiding

In 2×2 -connected,
CR-erasable
shapes

Map of the Results

Goal: Classification

Data: $(\bullet\bullet|\bullet\bullet)$ is equivalent to $(\bullet\bullet|\bullet\bullet)$ in Young shapes.

(i) Computer exploration suggests many more equivalences in various classes of shapes. (ii) Generic shapes have no equivalences.

Want to know: (i) Given a shape, which patterns are equivalent? (ii) Given two patterns, in which shapes are they equivalent? (iii) Given a class of shapes, which patterns are equivalent in each of its shapes?

Cannot (?) know: (i) Which patterns are not equivalent, given a shape? (ii) In which shapes are two given patterns not equivalent? (Reason) Pattern-avoiding fillings of two types could just happen to be equinumerous without a systematic cause.

Goal: Give answers to (i) and (ii) ~~are~~ that are as broad as we can get. Answer (iii) precisely for all interesting classes.

Bijections by Example

 Find forbidden pattern in the following search order, replace it by its reflection, repeat. The order is read left-to-right for the \rightarrow map, and right-to-left for \leftarrow .

The and boxes mark the first pattern found, for and, resp.

extend

shrink

EASY SHAPE

HARDSHIPS

ask me 😊

Example Application: All equivalences in Young shapes

Pattern pair equivalence classes: (not listing complements)

- (i) $(\begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \bullet \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \bullet \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \bullet \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \bullet & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \bullet \end{smallmatrix}),$
 $(\begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \bullet & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \bullet \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix}).$
 ↑↑ by recurrences ↑↑ J-diagrams acyclic orientations
- (ii) $(\begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \circ & \bullet & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}).$
- (iv) $(\begin{smallmatrix} \circ & \bullet & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix}).$
 ↑↑ by bijection ↑↑
- (iii) $(\begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \bullet & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \circ & \bullet & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \circ & \circ & \circ \end{smallmatrix}).$
- (v) $(\begin{smallmatrix} \circ & \bullet & \circ \\ \circ & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \bullet & \circ \\ \circ & \circ & \circ \end{smallmatrix}), (\begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix} | \begin{smallmatrix} \circ & \circ & \circ \\ \bullet & \circ & \circ \end{smallmatrix}).$
 ↑↑ by bijection ↑↑
- no other equivalences.

For the above Young shape, computation shows there are no other equivalences. So, the above list of classes is complete.

Goal: Give such classifications for other interesting shape classes.

Note: Several more classifications can likely be given from the current theorems.

Conclusions and Future Work

- Completely described Young shape pattern-avoidance.
- Results partially describe many other, larger shape classes.
- Computer experiments suggest there are other, "less common" equivalences left to prove.

Thanks!

To the FPSAC'08 organisers, to Alex Postnikov, to Matthieu Josuat-Vergès, and to the reviewers. ☺
